Awareness Morphs Contained Within Set

Here is an example of the morphing process, and some tips on what to look out for.

This is the person who's
passport has been
stolen

This is an image of the
fraudster (the person
who has stolen the
passport)

The fraudster can use commonly available technology (e.g. photoshop) to make a new morphed image which can contain different 'amount's of the owner's face and their own. Here are some examples.

Tip 1: Ghost like outline of another face

Tip 2: Does the image look altered in any way

100% Image of
Owner

20% of
Fraudster's face
added

40% of
Fraudster's face
added

60% of
Fraudster's face
added

80% of
Fraudster's face
added

100% Image of
Fraudster

Tip 3: Changes at the neck area (ghost outline of another person's shirt collar for example)

Tip 4: A dark patch over forehead could indicate a morph (one person wears hair up, the other down)

Occupational Experience

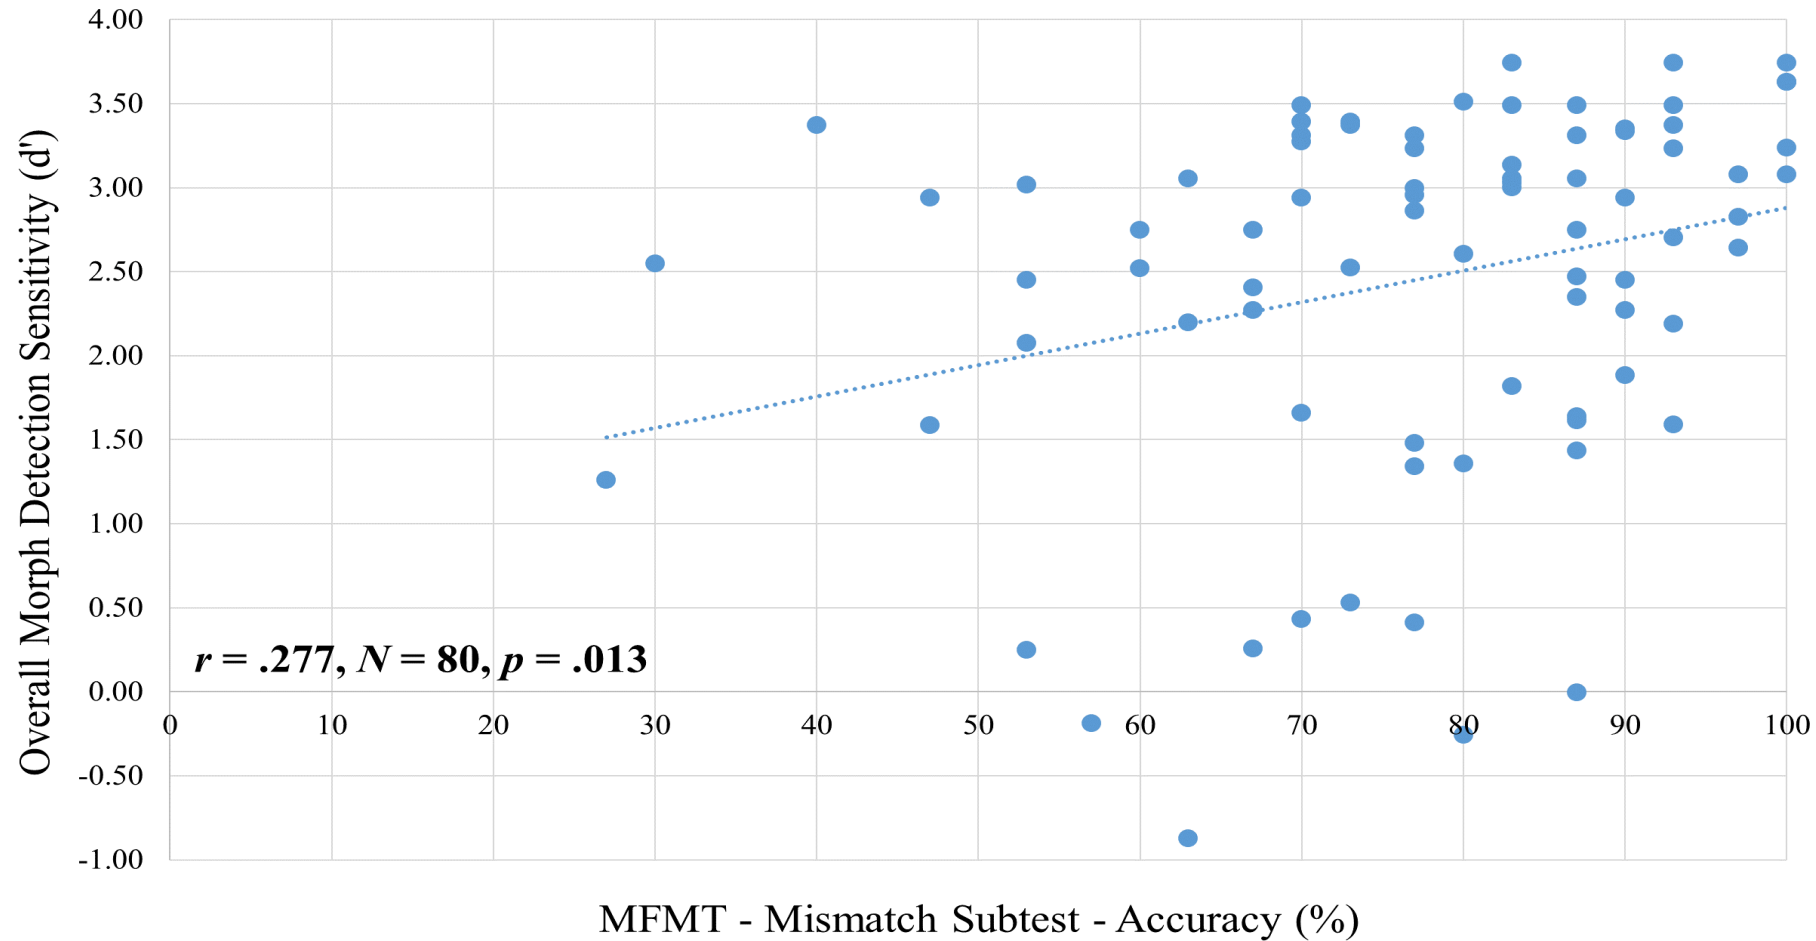

Super-recognisers?

Towler, A., Kemp, R. I., Burton, A. M., Dunn, J. D., Wayne, T., Moreton, R., & White, D. (2019). Do professional facial image comparison training courses work?. *PloS one*, 14(2), e0211037.

Data From Study 2

MFMT Mismatch Accuracy vs. Morph Detection Sensitivity

Support for selection

Summary

- Morphed passport photos are difficult to detect
- Awareness/Detection guidance improves performance
- Basic 2AFC training can provide a further benefit
- Identity recognition/morph detection may be linked
- Present data supports a selection and training approach

Caveats & Considerations

- We assume our set includes poor/moderate quality morphs
- Only use Caucasian observers/Caucasian Morphs
- Science/Practitioner partnerships (accessing real F. Attempts)
- May therefore be overestimating human detection rates
- See recent paper by Kramer et al. (2019)
- High quality morph detection may be beyond human perceptual capabilities
- Machine detection may be the best approach
